The well-known environmentalist Bruno Comby of why the world should develop nuclear energy even after Fukushima

French professor estate - nuclear physicist by training, an independent scholar and founder of the International Association "Environmentalists for nuclear energy." The fact that the energy of the atom safer than any other, he convinced not only millions of followers around the world, but, for example, the father of ecological thinking, Professor James Lovelock and the founder of "Greenpeace" Patrick Moore. The arguments of Mr. and listened to the estate correspondent "MK".

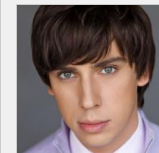

- This is not your first visit to Russia, who invited you and what you have had a program?

- Yes, in Russia I have a second time. In 2009 came the

presentation of my book "Environmentalists for Nuclear Energy" in Tomsk, where we met with Kirill Komarov of Rosatom (Deputy Director of the corporation - "MK"). After some time we met in Brussels, where Mr. Komarov spoke with a very interesting lecture. Then he invited me to visit you again and to speak at the forum "Atomeco." And I in turn asked if I could visit the Russian nuclear power plant. The fact that I traveled a lot of nuclear power plants around the world, but in Russia and has not been. And Mr. Komarov arranged for me this visit, I made presentations and lectures, and also went to the Kalinin nuclear power plant.

- And what are your impressions? You can compare our plant with other global stations?

- Impressions were very good. I asked many questions and all received satisfactory answers. The station is well designed, properly maintained, it has several levels of security as well as on foreign nuclear power plants. In addition, there are always observers, experts from different countries. In fact, in your way of operating nuclear power plants are some good features. I mean, that part of the side heat you do not refrigerate, as is customary in the world, but to focus on heating homes. About Kalinin live more than 30 000 people, and warm them so much cheaper and better from an environmental point of view, than to burn oil or coal. I will give your plant as an example in lectures given in France.

- You came to us with a report that a nuclear power has no competitors. Not hard to "agitate" in the country, whose economy is based entirely on oil and gas?

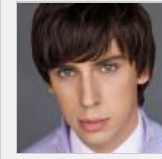

- I was here very warmly received, and no one thinks I'm the bad guy. (Laughs) Actually, except oil and gas industry, your country is the world leader in nuclear power. Of course, I support it, to completely abandon the renewable resources that do serious harm to the environment. But it is clear that you do not want to sacrifice one kind of energy to develop the other hand, when you can save the world leader in all three. In addition, the development of nuclear industry you may just due to the huge funds that receive oil and gas. Sooner or later your country in any case fully switch to nuclear power as alternatives to today simply do not have: renewable resources run out, as wind and solar power will not suffice for the needs of people. We are in France at the time the atom chosen because we had no oil, no gas, no coal, nor to the choice. And soon it will not and the rest of the world.

- You say that there is no alternative to nuclear power, and sooner or later it will come to all countries. Then why now this discussion is why to convince the public that nuclear energy is better than the rest?

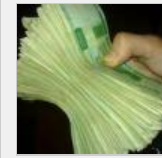

- France to completely rebuild a nuclear infrastructure, it

took 25 years. And when renewable resources run out, other countries need the same 25 years to rebuild our energy system. Well we did not have this gap, because in the worst scenario, civilization could simply collapse. That is why it is important now to talk about it, and politicians - to make the right long-term solutions.

- We have a political decision for the good of the country are accepted on the basis of economic gain. How much benefit from nuclear energy compared to oil or gas?

- When we use energy resources, we need to constantly buy new material. If you are using nuclear energy, will have to make significant investments in nuclear power plants under construction, but later investments will be equal to almost zero. At first glance it seems that the used oil is cheaper. But if you compare the cost of energy, we obtain for the last 50 years (average lifespan of nuclear power plants), it turns out that to build a station leaves a lot cheaper than the same 50 years to purchase oil or gas. The problem is that our politicians do not make decisions for the next 50 years. Maximum - 4 years. It's very sad, because over time the economic benefits of nuclear energy is only growing: now, for example, there are fourth-generation reactors, where the burning of uranium is much more efficient. But because of the anti-nuclear pressure and foolish policy decisions have the latest technology to minimize, as was done in Germany. Now, for your leadership and you must save it for the sake of our common future.

- But people are afraid of the energy of the atom so far. In the summer, for example, the construction of the outer wall of the Leningrad nuclear power plant collapsed reinforcing cage. Construction error is not related to nuclear technology. In a society that led to increased interest.

- You have to understand that mistakes happen in any industry, no one is perfect, and zero risk does not exist. However, unlike other areas of energy, to nuclear attracted most media attention, it is under very serious pressure and control of society and therefore is the most secure. In the coal industry have died about 10 000 miners in the year, it happens so often that we have to treat these deaths in order. How many people died in the Leningrad nuclear power plant?

- Not at all.

- Zero victims, no radiation. But do you know about this case, because the news media immediately picked up. Agree that the industry in which there is a small construction incident - and to know the whole country - a very safe industry. In other industries will something much more serious, and you never hear about it.

Correctly select the clothes for the winter holidays
The basic principle in the choice of clothing for winter sports or hiking - layering (so-called "principle of cabbage").

- Governments possessing nuclear technology, after Fukushima confirm consistent course to develop nuclear energy. Waiver of building new nuclear power plants have voiced only by the Germans. This happened for political reasons under severe pressure from public opinion. The level of public confidence in nuclear energy development program has declined in some countries.

- It is important to understand why public opinion has declined. And I'll answer that question, thanks largely to the reporters. You remember, Radiation nobody died. 28 000 people have died from the tsunami - not because of radiation. It is said that natural disasters pose a serious threat to the plant, and it is fraught with victims. But why not say that the same disasters pose a threat to the coal mines, for example? After the tsunami many people died just in the mines. After a disaster, "hot heads" are trying to talk about the end of an era of nuclear energy. But let's be fair. Have you seen the video on the Internet, where people were a car, and then they would be swept tsunami? So, needless to say about the end of the era of driving cars? After the accident, experts further improve security at nuclear power plants, but now the number of victims per kilowatt of the industry - the safest in the world. It is important to understand why we turned to nuclear energy. There were two reasons for running out of oil, and the problem starts with the climate. Fukushima happened, but these two factors have not gone away. You can not just slam the door, stop all the debate about nuclear energy, they say, is evil, we are scared and do not want to talk about it. In general, all of humanity today reminds me of the big yellow bus passengers. It's warm, full of food, playing music and all dance and enjoy life. Even the driver is not looking at the road, and looks into the saloon and dance on the seat. Once the bus rushes into the abyss, and every year more and more rapidly. And instead of notice this gap in front and to discuss how to avoid it, we continue to sing and dance. And when we notice the bus will drop already, and it will be too late. That is why today the country who have knowledge, but is first and foremost Russia should maintain and develop them. It is your Responsibility huge, so please try not to throw the latest technology in window. You still have to show the world the right way.
